Secretary Mike Leavitt
Department of Health and Human
Services
200 Independence Ave. SW
Washington, DC 20201

**Re: Alzheimer's Disease is Substantially Preventable. Petition
to the Food and Drug Administration on Food Additives.**

Dear Secretary Leavitt,

Reduction of aluminum in the American diet - one of the most
aluminized in the world due to food additives - has every potential of
reducing the shortfall of the medical trust funds by 23 to 42 percent over the
next fifty years by reducing the incidence of Alzheimer's and elderly mental
impairment.

Enclosed is a petition to the Food and Drug Administration and review
of evidence paper describing this situation. Alzheimer's is a multi-factor
disease. However, the epidemiology evidence makes it clear that aluminum
is one of the most potent risk factors.

There is a need to begin a national Alzheimer's prevention program
now rather than later, considering the spike in aging that approaching the
nation. Unprevented Alzheimer's will remain very difficult to treat, because
substantial brain atrophy already involved even at time of diagnosis.

We hope this is helpful, and that you could take some initiative.

With best regards,

Erik Jansson, Exec. Dir.
